With a very wide range of voltage available, almost any test voltage is possible in this voltage range. In addition to many standard test voltages, we also supply any special test voltage to suit your application. In addition to the test voltage, the required test current is of course also very important. The current range extends from safety current limited 3 mA up to many amperes.

Our DC high-voltage testers either have very precise and extremely voltage stable DC sources of various power ratings or are equipped with diodes for rectifying an AC high voltage.

The applications for the high-voltage test equipment range from laboratory applications for type testing to routine testing in series production
